1 field semantics
the declared number is a different quantity from the validated one
G01: freeboard sigma 0.0089 m vs freeboard error 0.0915 m -> ratio 0.097
2 error propagation
the sigma covers one retrieval stage; the user receives a derived product
thickness = f(freeboard, snow depth, density) declared 0.6163 m vs measured 0.701 m -> ratio 0.879
3 support confusion
aggregation level and grid level carry the same single 'accuracy' number
G17 pixel 0.071 m3/m3 G18 areal 0.040 m3/m3 both vs 0.040 objective -> 0.56 vs 1.00
